A GUIDE TO LIGHTING

The HØLTE pantry kit is supplied complete with LED lighting, but apart from that we do not supply LED cabinet lighting.

We have a close working relationship with a lighting supplier and can provide advice on use of their products but unfortunately we cannot specify lighting designs.

We will happily provide rebates and drill outs in cover panels to accommodate countertop lighting fittings. There are two options for countertop lighting – strip & spot.

Strip lighting

A continuous LED strip tape is set into an aluminium profile that is recessed into the cover panels on the underside of wall cabinets. This provides a consistent, even light source.

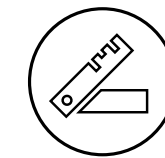

We set the rebate for the LED strip 40mm back from the front edge of the cover panel so that the light source is located centrally on the worktop.

Spot lighting

LED spots are set at even distances into the cover panels on the underside of wall cabinets. The light is less consistent, but the fitting is less visible.

We would recommend using either 'Very Warm White' or 'Warm White' light fittings (2700k–3200k).

You will need to establish with your electrician where the switch for the under cabinet lights will be located – typically either on a wall mounted control panel with the other lighting in the room, or a small switch mounted into the cover panel on the underside of the cabinet.

You will need to ensure there is a power supply located in an appropriate location to power the lights, as well as deciding a location for the driver (a small box that regulates the power supply). The best location for drivers is in the extractor cabinet, but they can be tucked in the back of any cabinet, or on top of cabinets if they won't be seen from normal day to day use of the kitchen.
